Detection Limits

The detection limits stated in the tables below are valid for following operational conditions:

- flow rate = 3 l/min
- $k_{1-\alpha}$ =3 (99.8%)
- $k_{1-\beta}$ = 1.65 (95%)
- 1DAC(Pu) = 0.2 Bq/m³ (10CRF835)
- 1DAC(Sr90) = 200 Bq/m³ (10CRF835)

Additionally for Beta measurement:

- F = 0.6
- gamma background = 0.1 µSv/h

The assumption for the detection limit of the concentration is a momentarily step-like increase of air activity concentration up to the detection limit at the beginning of a sampling interval. Furthermore it is presumed that there was no LLRD activity deposited on the filter.
